

What are the real savings to be made when moving to Mac?

As Apple devices have become popular with consumers over the last ten years, enterprises are starting to realise the benefits to be gained by deploying more Macs. To help you work out what the real savings are we have summarised everything you need to know here.

Windows

Mac

The gap between Windows devices and Mac is already significant at this point, but it's important to consider ongoing support cost. IBM talked about how much less support their Mac users needed vs. their Windows users.

Less support time = fewer resources tied up.

Management systems are essential in any environment. Mac + Jamf provides everything you need. While Windows needs SCCM + Intune to be fully manageable.

Mac hardware is more expensive than the average PC but when you consider what you need to add to a PC - Windows 10 Pro, antivirus software, deployment imaging, just to match the Mac out the box, the Mac comes out cheaper.

Whether you use a PC or Mac base services cost the same; power, licenses for Office (as most users are familiar with it), binding to your directory (probably MS Active Directory), and software distribution.

It is easy to dismiss Apple as too expensive if you just consider the cost of the hardware. The truth is though, building or extending an existing IT environment is about more than just the hardware as the chart above shows.

Given the amazing savings you could make moving to Mac don't wait any longer.
